

# Agenda of the ICCTM-Stickiness TF 2018

- Introduction
  - HarCoStiC
  - RTStick: results and future
  - Comparison of results
- The effect of ETO fumigation on stickiness. René van der Sluijs
- Contest-Fibermap: Contest-Fibermap: the first year of field testing on stickiness detection. Gabrielle Salvinelli
- Embrapa: Developing a Portable Device Using NIR Image for Easy Detection of Stickiness in Cotton. Liv Severino
- KOTITI: Announcement
- Prodev: Announcement
- CIRAD: Announcement
- Conclusion

# ITMF-ICCTM Stickiness task force

## Results of the 2017 international round-test of stickiness measuring methods

Jean-Paul Gurlot, Serge Lassus, Axel Drieling, Karsten Froese  
Bremen, March 2018

# Stickiness in spinning mill due to entomological sugars

These sugars or honeydew are mainly produced by *Aphis* and *Bemisia*, ...  
but new insects are coming (mealybug, ..., due to resistance, GMO...)

*Aphis gossypii*

Honeydew on open boll

*Bemisia tabaci*

Honeydew in fibers

Problems } Productivity, quality 

=> Need for reliable characterization (method, reference material, predictive of problems in spinning...)

Reminder

Two of the mandates of the ICCTM are:

[.../...] “to harmonize cotton testing results by means of:

- a. proposition and support for the international standardization of test methods
- b. development of guidelines for testing
- **c. technical evaluations using world-wide round tests.**

and to discuss the problems related to testing of cotton fiber properties and their relations to cotton processing.”

[.../...]

- To check the ability of each measuring technique to reproduce itself within a same single laboratory
- To check the ability of each measuring technique to reproduce itself between several laboratories
- To give some indications about the ability of various measuring techniques to correlate to each others

Reminder

One RT conducted in 2013-2014

=>report 2014 and 2016 (instruments vs micro-spinning)

➔need harmonization

➔need creation of reference materials

- To check the ability of each measuring technique to reproduce itself within a same single laboratory
- To check the ability of each measuring technique to reproduce itself between several laboratories
- To give some indications about the ability of various measuring techniques to correlate to each others

Reminder

One RT conducted in 2013-2014

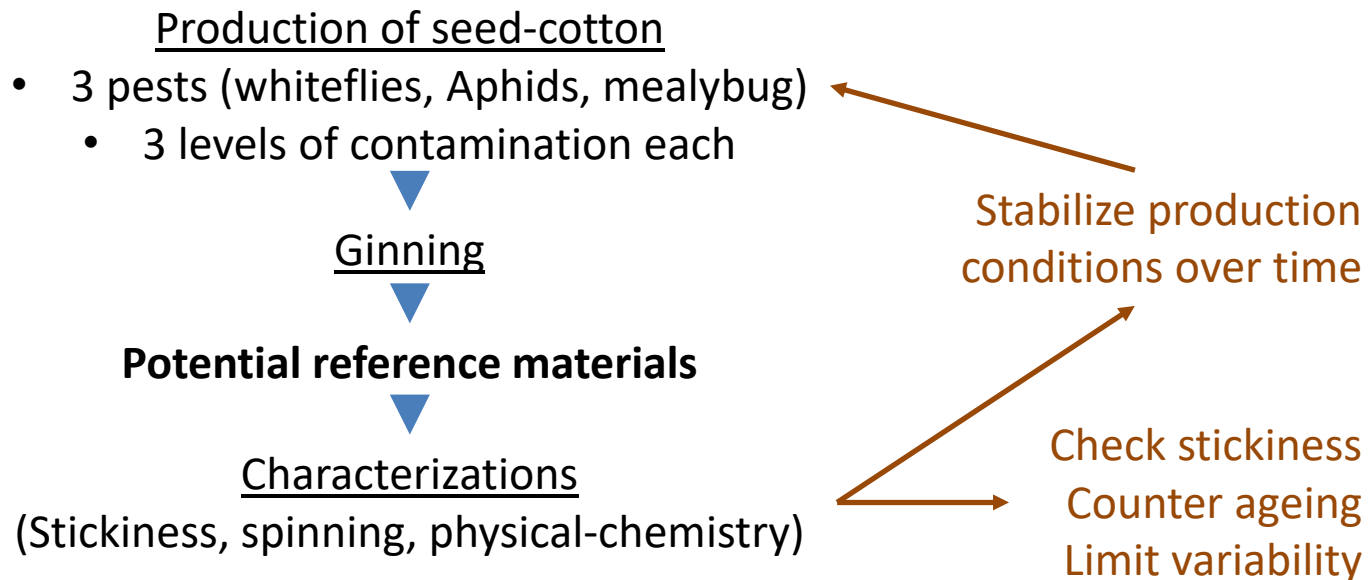

=>report 2014 and 2016 (instruments vs micro-spinning)

→need harmonization

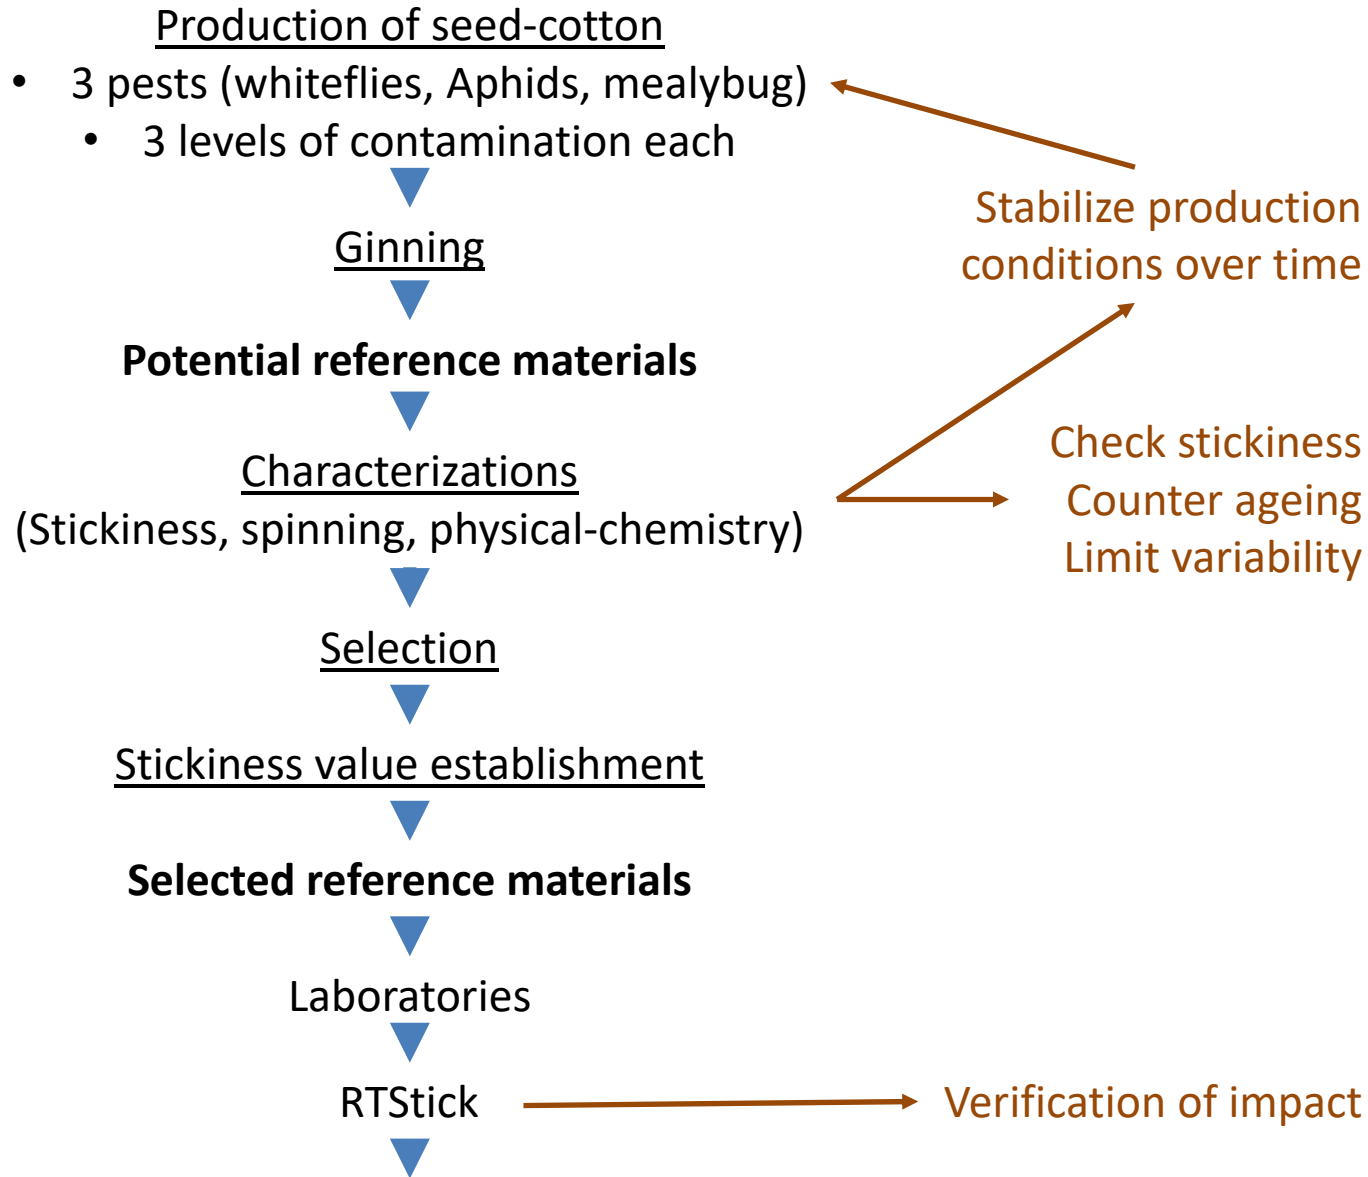

→need creation of reference materials

→proposed project

# Proposed project HarCoStiC

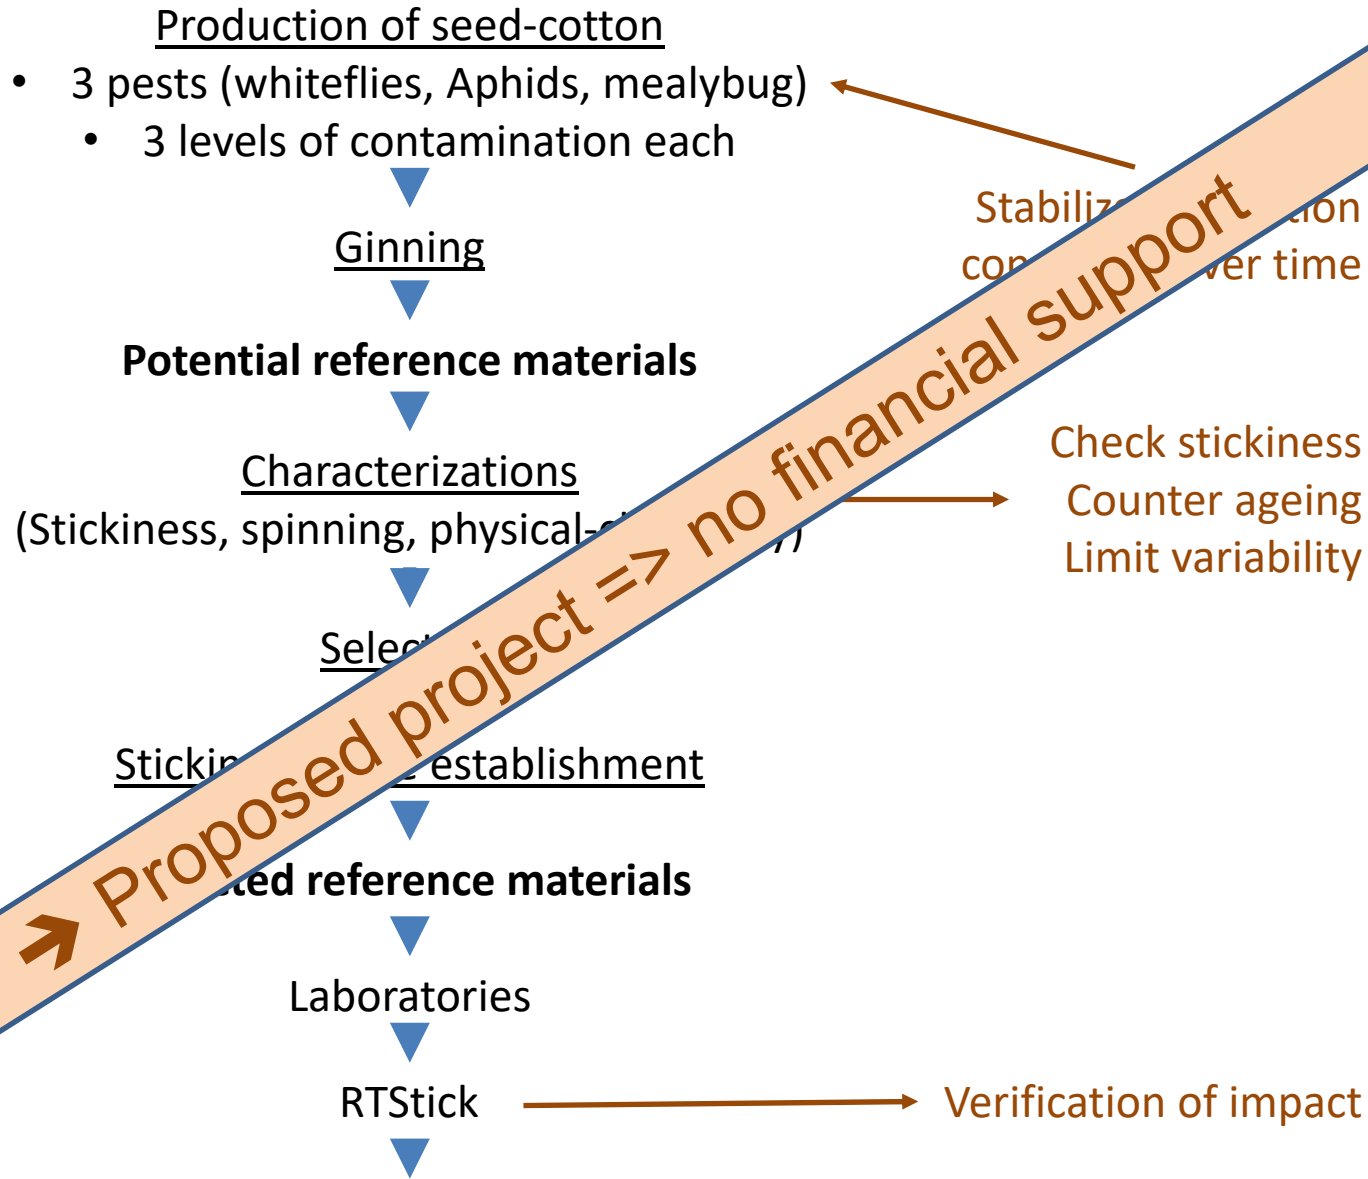

# Proposed project HarCoStiC

## Harmonization of Cotton Stickiness Characterization

# Proposed project HarCoStiC

→ Proposed project => no financial support

Stabilization  
contamination  
over time

Check stickiness  
Counter ageing  
Limit variability

Stepwise improved procedure

## Harmonization of Cotton Stickiness Characterization

# Proposed project HarCoStiC

- Production of seed-cotton
- 3 pests (whiteflies, Aphids, mealybug)
    - 3 levels of contamination each

Ginning

**Potential reference materials**

Characterizations

(Stickiness, spinning, physical-chemical)

Select

Stickiness reference establishment

**Selected reference materials**

Laboratories

RTStick

Stabilization  
contamination over time

Check stickiness  
Counter ageing  
Limit variability

Verification of impact

→ Proposed project => no financial support

Stepwise improved procedure

## Harmonization of Cotton Stickiness Characterization

# Periodic international inter-laboratories round-tests on stickiness

- One RTStick initiated in 2017
  - Planned for 2 times / year
  - Possibility of having up to 6 measurements / cotton
  - Anonym participation (one LabID / test)
  - 2017-1 and 2017-2 conducted
- Organized and funded by CIRAD, BBB and FIBRE
- Methods
  - No micro-spinning
  - Used in laboratories
- Three cottons (various origins) per test covering a range

# Periodic international inter-laboratories round-tests

- Please fill-in the following information table :

| Item / question   | Answers |       |
|---|---------|-------|
| Lab name / company (will stay confidential)   |         |       |
| Lab code number   |         |       |
| Name of the Person in charge  |         |       |
| Name of the Technician in charge of the tests   |         |       |
| Date of the tests (DD/MM/YYYY)  |         |       |
| Temperature of the lab when testing   |         | °C    |
| Relative humidity in the lab when testing   |         | %     |
| Duration of the sample conditioning prior testing (hours)   |         | hours |
| Name of the testing technique   |         |       |
| Identification of the instrument (necessary at least in case of more than one instrument participating) |         |       |
| Unit used for reporting results in the following table (sticky points, grade, percent, or else)         |         |       |
| If else, please explain the scale used  |         |       |

# Periodic international inter-laboratories round-tests

- Please fill-in this table with your results:

| Sample             | Sample A | Sample B | Sample C |
|--------------------|----------|----------|----------|
| Result 1           |          |          |          |
| Result 2           |          |          |          |
| Result 3           |          |          |          |
| Result 4           |          |          |          |
| Result 5           |          |          |          |
| Result 6           |          |          |          |
| Comment for sample |          |          |          |

# Participation in 2 RTs

| Methods             | RT 2017-1     | RT 2017-2* | RT 2018-1         |
|---------------------|---------------|------------|-------------------|
| Benedict            | 1             | 0          | New labs welcomed |
| Caramelization      | 4             | 4          |                   |
| Clinitest           | 1             | 1          |                   |
| Contest             | 3             | 3          |                   |
| Fibermap            | 2             | 2          |                   |
| H2SD                | 4             | 3          |                   |
| KOTITI              | 1             | 1          |                   |
| Minicard            | 4             | 4          |                   |
| Quantitative meth.  | 1             | 1          |                   |
| Reactive spray/heat | 1             | 1          |                   |

# Sticky Cottons in RTs

- RT\_2017-1:

Check 1

- A (blended using CSITC blending machine)
- B (same cotton as A, blended using mini-card with smooth flats)
- C (blended using CSITC blending machine)

- RT\_2017-2:

Check 2

- A, B, C, blended using CSITC blending machine
- A = C of 2017-1

- RT\_2018-x:

- 10 kg/cotton required,
- call for anonym provision of sticky cottons for feeding RTs

# Check 1: effect of preparation

# Units and scales for stickiness results

| Methods             | Unit       | Scale RT 2017-1 |
|---------------------|------------|-----------------|
| Benedict            | grade      | 0 - 2           |
| Caramelization      | +b         | 0 - 3.5         |
| Clinitest           | +b         | 0 - 2.5         |
| Contest             | grade      | 0 - 585         |
| Fibermap            | grade      | 0 - 750         |
| H2SD                | points     | 0 - 60          |
| Kotiti              | grade      | 0 - 9           |
| Minicard            | ITMF grade | 0 - 3           |
| Quantitative meth.  | %          | 0 - 1.2         |
| Reactive spray/heat | grade      | 0 - 4.5         |
| SCT                 | points     | 0 - 100         |

# Units and scales for stickiness results RTStick 2017-1

Individual readings per Method and LabID

## Units and scales

Could we express results in a common scale?

What for?

- Compare methods
  - Sensitivity, Resolution, Precision, Accuracy,
  - Reproducibility
  - Repeatability
- Improve
  - Correlation within and between methods

# Units and scales

## Example: xMax / RT 2017-1

| Method                 | Result | xMax test | CommonScale |
|------------------------|--------|-----------|-------------|
| Minicard (grades)      | 3      | 3         | <b>100</b>  |
|                        | 2      |           | <b>67</b>   |
|                        | 1      |           | <b>33</b>   |
|                        | 0      |           | <b>0</b>    |
| SCT (nb sticky points) | 100    | 100       | <b>100</b>  |
|                        | 66     |           | <b>66</b>   |
|                        | 63     |           | <b>63</b>   |
|                        | 0      |           | <b>0</b>    |
| A (any unit)           | 555    | 600       | <b>93</b>   |
|                        | 200    |           | <b>33</b>   |
|                        | 190    |           | <b>32</b>   |
|                        | 0      |           | <b>0</b>    |

Rounded( $100 * \text{Result} / \text{xMax}; 0$ )

# 'Common' scale for stickiness measurements?

## Application xMax to RTStick 2017-1

# 'Common' scale for stickiness measurements?

Example : xMaxEver

| Method                 | Result | xMaxEver    | CommonScale |
|------------------------|--------|-------------|-------------|
| Minicard (grades)      | 3      | 3           | <b>100</b>  |
|                        | 2      |             | <b>67</b>   |
|                        | 1      |             | <b>33</b>   |
|                        | 0      |             | <b>0</b>    |
| SCT (nb sticky points) | 100    | 100 => 200  | <b>50</b>   |
|                        | 66     |             | <b>33</b>   |
|                        | 63     |             | <b>32</b>   |
|                        | 0      |             | <b>0</b>    |
| A (any unit)           | 555    | 600 => 1000 | <b>55</b>   |
|                        | 200    |             | <b>20</b>   |
|                        | 190    |             | <b>19</b>   |
|                        | 0      |             | <b>0</b>    |

$\text{Rounded}(100 * \text{Result} / \text{xMaxEver}; 0)$

## Units and scales

Could we express results in a common scale?

**Interesting and usefull only if really the same indicator is measured**

⇒ **Stickiness or any indicator proven closely related to stickiness**

“the propensity of fibers to stick to spinning parts during their processing”

⇒ **Any method subject to recognition should demonstrate that point**

Subject to discussion...

## Additional notes: respect of testing conditions

- Minicard test should be performed at 55%RH according to 1988 ICCTM proceedings, page 12:

Atmosphere -  $24^{\circ}\text{C} \pm 1^{\circ}\text{C}$ ,  $55\% \pm 2\%$  RH

Sample size - 10g, 11 x 25cm batt

Passage time - 3 to 5 min

Stickiness ratings:

- 0 - No stickiness
- 1 - Light stickiness
- 2 - Moderate stickiness
- 3 - Heavy stickiness

- Other methods: Subject to discussion...

# Estimated costs of each RTStick occurrence

# Using NIR Image for Detection of Stickiness in Cotton

Cotton samples:  
sugar spots are  
invisible

High resolution  
image acquired  
in NIR-HYS

After filtering  
sugar spots  
become visible

Sugar content is estimated in a  
cheap, fast, reliable and non-  
destructive method.

This method is under  
development. The proof of  
concept was successful and test  
are initiating in a textile industry.

Full presentation: Session IX (Friday, 9-11:30, Room 506)

# Introduction

## ISO 12027:2012 Textiles—Cotton-fibre Stickiness

### — Detection of sugar by color reaction

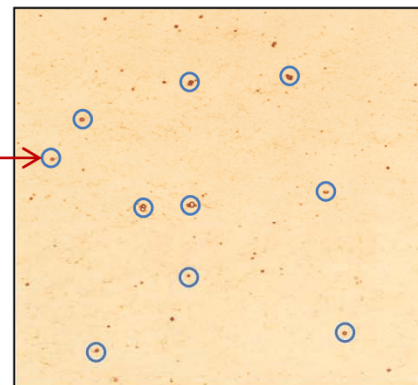

- New ISO standard **visualizes the honeydew droplets in cotton** and evaluates the degree of honeydew contamination.
- Honeydew droplets that may occur in a specific cotton web with its fixed surface area and mass are transferred to color reaction paper by applying pressure.
- The transferred honeydew is developed on the color reaction paper by using forced convection oven at 120°C for 5min.
  - According to HPLC results of color reaction points, **trehalulose and melezitose could be detected.**
- The field test on this new test method was done and the results showed very good relationship with actual stickiness behavior

Sticky cotton

Honeydew droplets

Color reaction paper

HPLC results of color spots

# Test procedure

## STEP 1

### Preparation

- Preparation of sample web
  - A web (10×10cm) is prepared after impurities are removed by using the instruments such as MDTA 3.
- Preparation of color reaction paper
  - By wetting paper having a certain degree of pore size with a solution for color reaction

## STEP 2

### Color reaction

- (1) contacting sample web with color reaction paper
- (2) Development of color reaction paper

- Transfer of honeydew from sample web to color reaction paper by contacting together
  - Pressing condition
    - *weight : 4 kg / (10 × 10 cm), time : 1 min*
- Development of color (by using instrument such as forced convection oven)
  - Development condition of color reaction paper
    - *120 °C × 5 min*

## STEP 3

### Grading of cotton stickiness

- Grading by comparing with standard replicas under visual evaluation
- Grading by image analysis program

# Visual assessment using cotton fibre stickiness replicas

- Stickiness grade is evaluated by comparing the appearance of **the developed brown spots(honeydew reaction)** with a series of five visual replicas

ISO 12027 Textiles—Cotton-fibre Stickiness—Detection of sugar by color reaction

## Cirad

- Produces a small quantity of reference materials for calibrating SCT and H2SD
- Can check SCT instruments using a 30 years old 'standard' routine

Email: [serge.lassus@cirad.fr](mailto:serge.lassus@cirad.fr)  
[technologie.coton@cirad.fr](mailto:technologie.coton@cirad.fr)  
[coton@cirad.fr](mailto:coton@cirad.fr)

And... what is the surprise?

# Stickiness...\*

## Also look into your instrument!

After 1 800 combs  
(300 samples \* 6 meas.)

After 1 620 combs  
(270 samples \* 6 meas.)

# Stickiness...\*

## Also look into your instrument!

Cleaning at the beginning

After 480 combs

After 960 combs

After 1440 combs

# Discussion conclusion

## ICCTM-Stickiness TF 2018

- RTStick 2017: Conclusions: similar to RT2013-14
  - Still remain differences between labs within each method
  - Still remain large differences between methods
- RTStick: Organizational matters
  - Sample dispatch has been problematic
  - Feeding the RT with cotton: call for proposals
  - RTStick will continue
- Proposal of a method to compare results
- Proposal of HarCoStiC\* project
  - Reference materials + a common scale + RT Stick  
= basis of harmonized measurements
- Progress report for Contest and Fibermap
- NIR technology in Embrapa
- Prodev continues producing SCT and H2SD
- Production of some reference materials / check of SCTs
